DEPARTMENT OF ENERGY	LESSON PLAN
	Course: Radiological Control Technician Unit: Site Academics Lesson: 2.07 Respiratory Protection

Learning Objectives:

2.07.01 Explain the purpose of respiratory protection standards and regulations.

2.07.02 Identify the OSHA, ANSI, and DOE respiratory protection program requirements.

2.07.03 Identify the standards which regulate respiratory protection.

2.07.04 Describe the advantages and disadvantages (limitations) of each of the following respirators:

a. Air purifying, particulate removing filter respirators

b. Air purifying, Chemical Cartridge and Canister respirators for Gases and Vapors

c. Full-face, supplied-air respirators

d. Self-contained breathing apparatus (SCBA)

e. Combination atmosphere supplying respirators

2.07.05 Define the term protection factor (PF).

2.07.06 State the difference between a qualitative and quantitative fit test.

2.07.07 State the recommended physical functions the subject must perform during a respirator fit test.

2.07.08 State how the term protection factor (PF) is applied to the selection of respiratory protection equipment.

2.07.09 State the general considerations and considerations for the nature of the hazard when selecting the proper respiratory protection equipment.

☞ 2.07.10 Identify the types of respiratory equipment available for use at your site.

2.07.11 Identify the quality specification breathing air must meet.

LESSON OUTLINE | INSTRUCTOR'S NOTES

I. LESSON INTRODUCTION

A. Self Introduction

1. Name
2. Phone Number
3. Background

B. Motivation

Internal dosimetry controls require the use of engineering controls to prevent the internal deposition of radioactive and nonradiological contaminants. However, when engineering controls are not available or feasible, respiratory protection may be necessary. The RCT should know and apply the considerations used in determining the respiratory protection equipment that is most appropriate for the job. Inappropriate use of or the use of the wrong respiratory protection equipment may result in undesirable health effects.

C. Lesson Overview

1. Requirements and regulations
2. Types of equipment
3. Protection factors
4. Fit testing
5. Selection of respirators
6. Site respiratory equipment
7. Supplied air quality testing
8. Sorbents and protection against radioiodines
9. Communications

D. Introduction of Objectives — O.H.: Objectives

II. LESSON OUTLINE

A. REQUIREMENTS AND REGULATIONS

1. DOE Requirements

The DOE Radiological Control Manual and DOE Order 5480.4 mandate the requirements for a respiratory protection program contained in ANSI Z88.2 and 29 CFR 1910.134.

2. OSHA REGULATIONS - 29 CFR 1910.134

Purpose: Specify the minimal acceptable program which must contain or address the following: Objective 2.07.01

a. Written procedures

b. Respirators selection

c. The user shall be instructed and trained in proper use of respirators

d. Respirators assigned to exclusive use (when practicable)

e. Respirators shall be regularly cleaned and disinfected

f. Respirators stored in a clean, sanitary location

g. Respirators inspected routinely and replaced when necessary

h. Appropriate surveillance of worker area conditions and degree of employee exposure or stress

i. Regular evaluation of program

j. Persons should be physically able to use equipment as certified by a physician

k. Approved respirators shall be used when they are available

3. ANSI Z88.2 - 1980: *Further specifies the minimal acceptable program* Objective 2.07.02 Objective 2.07.03

a. Individual exposures limited by both inhalation and skin absorption

b. Air sampling and bioassays

c. Engineering controls are primary method

d. When an individual is exposed to greater than the specified DAC

e. Respiratory protection equipment must be NIOSH/MSHA certified

f. If allowance for use of respiratory protection equipment is made,

1) Protection factor must be greater than ratio of peak exposure concentration and associated DAC

2) Average concentration inhaled must be less than associated DAC

3) If exposure is later found to be greater than estimated, corrected value shall be used

If less than estimated, the corrected value may be used

4) Surveys and bioassays conducted as appropriate to evaluate actual exposures

5) Written procedures must be established

6) Determination by a physician of a user's physical capability

7) A written policy statement must be issued

Engineering controls
Emergency and periods of use

a) Engineering controls

b) Routine, non-routine and emergency use

c) Periods of use

8) Each user must be advised upon failure of equipment, physical stress or deterioration of operating conditions

9) Equipment is appropriate for environment and special equipment, such as communication devices issued when needed

10) Emergency use equipment must be specifically certified as such by NIOSH/MSHA

B. TYPES OF EQUIPMENT

Objective 2.07.04

1. Air purifying, particulate-removing filter respirators

LESSON OUTLINE	INSTRUCTOR'S NOTES
a. Description	"dust," "mist" or "fume" respirators
1) Filtering action removes particulate	
2) Operate in negative pressure (NP) mode	
3) Exception is a special type of powered air purifying respirator that operates continuously in positive pressure (PP) mode	
4) In power reactors only half face, fullpiece and air powered hood are approved	
b. Limitations	
1) Do not provide oxygen	NEVER be worn in oxygen-deficient atmospheres
2) No protection against gases or vapors	
3) Should not be used for abrasive blasting operations	
4) Battery operated respirators are limited by battery life	
5) High humidity increases breathing resistance as paper elements become water saturated	
2. Air Purifying, Chemical Cartridge and Canister Respirators for Gases and Vapors	
a. Description	
1) Use cartridges or canisters containing chemicals to react with specific vapors and gases and remove them	Difference between a cartridge and a canister is the volume of the sorbent. Canisters have longer capacity, and are used in gas masks.
2) In power reactors these respirators are used for protection against radioiodines	
b. Limitations	
1) Do not provide oxygen	NEVER worn in oxygen deficient atmospheres

2) Unless approved by DOE, no credit for protection against radioactive gases and vapors

3) High humidity shortens life of the sorbent material and increases breathing resistance

3. Atmosphere Supplying Respirators - Supplied Air

a. Description

1) Use central source of breathing air delivered to wearer through a line or hose

2) Either tight-fitting facepiece or loose-fitting hood/suit

3) Demand device - during inhalation there is negative pressure in mask

4) Pressure demand device - positive air pressure inside mask is maintained at all times

5) Continuous-flow air line - creates positive pressure in facepiece

6) At power reactors, virtually all supplied air operations use continuous-flow mode

b. Limitations

1) Not used in IDLH atmospheres (not for emergency escape or rescue)

2) Trailing air supply hose severely limits mobility

3) Length of hose, number of potential users and pressure of the supply system are interdependent

4) Control of air quality is essential

5) "Bubble suits" must be tested (for PF) for exact conditions of use

c. Special considerations

1) Where air line respirator is a suit, requires a standby rescue person with SCBA

2) Follow all manufacturers instruction and written facility/site procedures

3) If all hoses and fittings are same then a single pressure gauge is appropriate

4) For situations where each user has different hose lengths, different number of connection or different air pressure requirements then a separate pressure gauge should be used

4. Atmosphere Supplying Respirators - Self-Contained Breathing Apparatus (SCBA)

a. Description

1) Allows the user to carry a respirable breathing supply — Air supply may last 3 minutes to four hours

2) There are two groups of SCBA's closed circuit and open circuit

a) Closed circuit SCBA's - "rebreathing" device — Designed primarily for 1-4 hours use in toxic atmospheres

b) Open circuit SCBA exhausts the exhaled air to the atmosphere — Service life is shorter

c) Two types of open circuit SCBA are available, "demand" or "pressure demand"

- Demand SCBA - air flows into facepiece only on demand of the wearer — When the person inhales note: demand-type SCBA does not provide any higher degree of protection against airborne contaminants than air-purifying respirator with same facepiece, but it does provide protection against oxygen deficiency

- Pressure demand - maintains positive pressure in facepiece at all times regardless of "demand" of user — Recommended for emergency use, escape and rescue

b. Combination atmosphere supplying respirators

1) Combination Pressure Demand Breathing Apparatus provides respiratory protection for personnel who must work in atmospheres that are IDLH — Equipped with small air cylinder in case primary air supply (hose line) is interrupted

2) Dual-purpose Breathing Apparatus combines all capabilities of SCBA and a supplied air respirator in one unit

c. Limitations of the pressure and demand SCBA

1) Air supply is limited

2) Bulky and heavy

3) Demand type not for fire fighting — 10CFR50 Appendix R Section H

d. Special considerations of the pressure and demand SCBA

1) Only pressure-demand type SCBA should be selected for emergency use, rescue and reentry into contaminated area — Section 5.5 of NUREG 0041

2) Performance of SCBAs in high temperature environments, such as fires may lead to rapid deterioration of components

B. PROTECTION FACTORS — Objective 2.07.05

1. Overall protection afforded by a given respirator design is defined in terms of its protection factor (PF)

2. PF is defined as the ratio of concentration of contaminant in the atmosphere to the concentration inside facepiece or hood under conditions of use

3. PFs may not be appropriate where:

a. Chemical or other respiratory hazards exist in addition to radioactive hazards or

b. Mode of entry is through skin and not through inhalation — Example: 50% of the intake from exposure to tritiated oxide is through skin absorption

4. Application of PFs

C. FIT TESTING — Objective 2.07.06

LESSON OUTLINE | INSTRUCTOR'S NOTES

1. Definitions
   a. Qualitative fit test:

      Test to determine if there is any mask leakage, usually using irritant smoke

   b. Quantitative fit test:

      Test to determine quantity of mask leakage and assign a "fit factor," corn oil is the typical challenge atmosphere used

2. At least a qualitative test must be formed
3. Fit testing of individual is normally quantitative — Objective 2.07.07
   a. Involves measurement of a challenge atmosphere both inside and outside respiratory facepiece
   b. A "fit factor" is determined by dividing concentration of challenge atmosphere outside respirator by concentration inside facepiece — Note: DOP has been discontinued as a challenge atmosphere since it is a potential carcinogen
   c. Corn oil may be used as a challenge atmosphere
   d. Apparatus uses flame photometry as system for measuring challenge and breathing zone atmospheres
   e. Subject performs following functions during fit testing: — Instructor Notes: Highlight significance of functions as related to job performance
      1) Normal breathing
      2) Deep breathing
      3) Moving head from side to side
      4) Moving head up and down
      5) Frown
      6) Talking
      7) Running in place
      8) Normal breathing
   f. Additional factors to be considered

1) Use of communication devices

2) Sorbent canisters with respirators

4. Qualitative tests are performed to ensure adequate fit for user prior to each entry

   a. Can use challenge atmospheres such as Isoamyl Acetate (banana oil) or irritant smoke (e.g. stannic chloride)

   b. Maybe negative or positive pressure test — Irritant smoke test most effective

   c. "Immediately prior to use" qualitative test normally is a negative pressure test

5. Respirator face pieces and cartridges must be periodically tested

   a. Test a portion of particulate cartridges upon procurement — Minimum requirement - each site may be more restrictive

   b. Test all particulate cartridges prior to re-use

   c. Respirator facepieces are tested annually using:

      1) Test head mannequin — Penetration value of less than or equal to 0.003% is acceptable

      2) Challenge atmosphere with a light scattering photometer

D. SELECTION OF RESPIRATORS

1. Most critical factor: the protection factor for respirator device to be used needs to be greater than ratio of work area concentration to associated DAC — Objective 2.07.08; DOE Order 5480.11 Attachment 1

2. Only approved respirators shall be selected. — Instructor reference: ANSI Z88.2, 1980

3. General considerations. The selection of a proper respirator for any given situation shall require consideration of the following factors: — Objective 2.07.09

   a. The nature of the hazard

   b. The characteristics of the hazardous operation or process

c. The location of the hazardous area with respect to a safe area having respirable air

d. The period of time for which respirator protection may be provided

e. The activity of workers in the hazardous area

f. The physical characteristics, functional capabilities, and limitations of respirators of various types

g. The respirator-protection factors and respirator fit

h. Requirement of facility/site written procedures

4. Nature of Hazard. The following factors concerning the nature of the hazard requiring the use of respirators shall be considered in respirator selection:

   a. Type of hazard

      - Oxygen deficiency
      - Contaminant

   b. Physical properties

   c. Chemical properties

   d. Physiological effects on the body

   e. Actual concentration of a toxic material or airborne radioactivity level both average and peak

   f. Whether the hazard is an immediately-dangerous-to-life-or-health concentration

   g. Warning properties

5. Initial Monitoring of Respiratory Hazard, recognition and evaluation of the respiratory hazard (oxygen deficiency or contaminant(s)) shall be an essential part of selecting a respirator except in emergency or rescue operations. Initial monitoring of the respiratory hazard shall be carried out to obtain data needed for the selection of proper respiratory protection. The data should include:

   a. Identification of the type of respiratory hazard

1) Oxygen deficiency

2) Specific contaminant(s)

b. Nature of contaminant(s)

1) Particulate matter

2) Vapor(s) or gas(es)

c. Concentration of respiratory hazard

6. The following factors concerning the hazardous operation or process shall be taken into account in selecting the proper respirator:

a. Operation or process characteristics both as-built and modified

b. Work-area characteristics

c. Materials, including raw materials, end products, and byproducts (actual and potential)

d. Worker activities

E. SITE RESPIRATORY EQUIPMENT Objective 2.07.10

(Insert site specific material here)

F. SUPPLIED AIR QUALITY TESTING

1. Referenced in 30CFR11 Objective 2.07.11

a. Compressed breathing air shall meet at least quality specification for Grade D breathing air

b. Breathing air specifications are listed in ANSI Z86.1-1973

2. No explicit limit for water vapor but is contaminant

3. Acceptable analytical procedures for measuring the respirable air components

4. Frequency of performing air quality tests is not specified

a. For bottled air systems the tests should be performed on a representative sample of the bottles upon receipt

b. For facilities which generate respirable air, the sampling should be performed:

1) Prior to each lot fill

2) Once during the lot fill

3) Once upon completion of the lot fill

c. For compressed air supply systems sampling frequency is best performed prior to each use of a specific manifold system

In cases of heavy usage then a daily check of the system may be more appropriate.

5. Separate breathing air supply and distribution system is the ideal source or worker-supplied air

G. SORBENTS AND PROTECTION AGAINST RADIOIODINES

1. The regulations specifically prohibit the use of PF's for canister sorbents as protection against radioiodine atmospheres

   a. The charcoal canisters provided by most manufacturers do provide a measure of protection against radioiodine atmospheres

   b. The efficiency of the charcoal canister is dependent upon:

      1) chemical form of the radioiodine,

      2) humidity of the atmosphere,

      3) and breathing rate of the user.

2. Approval can be obtained to use PF's for sorbent cartridges

3. Limiting conditions of use:

   a. Total challenge in the work place (radioactive iodine, non-radioactive iodine or the halogenated compounds) may not exceed 1 ppm

   b. Temperature in the work area may not exceed 100 °F.

   c. Respirator wearers must have demonstrated a fit factor greater than 100.

   d. Service life is 8 hours maximum. This is calculated from the time the canister is unsealed and includes periods of non-use.

e. Canisters will not be used in the presence of organic solvents, vapors, or chemicals.

f. Canisters must be stored in sealed humidity-barrier packaging in a cool, dry environment.

H. COMMUNICATIONS

1. Conventional respirators distort the human voice to some extent

2. Special attachments are often needed to ensure adequate communications

   a. Speaking diaphragm

   b. Various methods of electronically transmitting and amplifying speech through the respirator

   c. Any communication device that is an integral part of respirator must be part of NIOSH/MSHA approval

IV. SUMMARY

A. Review major topics

1. Requirements and regulations

2. Types of equipment

3. Protection factors

4. Fit testing

5. Selection of respirators

6. Site respiratory equipment

7. Supplied air quality testing

8. Sorbents and protection against radioiodines

9. Communications

2. Review learning objectives

V. EVALUATION

Evaluation shall consist of a written examination comprised of multiple choice, fill-in the blank, matching and/or short answer questions. 80% shall be the minimum passing criteria for examinations.
